Vertebrates are a relatively small group of organisms under the phylum Chordata (see chart below). Chordates were the first animals to have a central support column and nerve cord running along their back. In vertebrates, this characteristic is called a backbone. The vertebrate backbone is part of a more extensive, internal skeleton. By comparison,

## [Introduction To Animals Vertebrates](#)

Vertebrates are animals that have backbones. Most vertebrates are immediately recognizable as animals. Sharks, birds, snakes, frogs, horses, and humans are all vertebrate animals. Invertebrates are animals that lack a backbone. Although most people only recognize a few kinds of invertebrate animals, invertebrates far outnumber vertebrates. In fact, 97% of all animals are invertebrates.

To most people, these are the animals that attract our attention. Concentrating on vertebrates, however, gives us a rather biased and limited view of biodiversity, because it ignores nearly 97 percent of the animal kingdom, namely the invertebrates. Invertebrate animals are those without a cranium and defined vertebral column or spine.
