In growing children, limb deformities of the legs are among the most frequent causes for a visit to the pediatric orthopedist. Both bowing of the legs, in which the knees are abnormally separated, and knock knees, in which the knees are abnormally close together, may first be noticed by a family member during early childhood.

[Congenital Lower Limb Deficiency – PM&R KnowledgeNow](#)

Careful analysis of the mechanical axis and joint relationships in a child with a long-standing, presumably isolated deformity of one lower limb segment often reveals the presence of subtle, usually compensatory, deformity in the adjacent bone segment . 31 In such cases, complete correction of one deformity will unmask a more subtle compensatory one. However, if the deformity is corrected until the limb appears clinically straight, offsetting residual deformities can leave the intervening ...
