However, chance agreement due to raters guessing is always a possibility – in the same way that a chance “correct” answer is possible on a multiple choice test. The Kappa statistic takes into account this element of chance. The Kappa statistic varies from 0 to 1, where. 0 = agreement equivalent to chance. 0.1 - 0.20 = slight agreement.

I am looking for a Python function (or to write my own if there is not one) to get the t-statistic in order to use in a confidence interval calculation. I have found tables that give answers for various probabilities / degrees of freedom like this one, but I would like to be able to calculate this for any given probability. For anyone not ...

[P-value from Chi sq test statistic in Python - Stack Overflow](#)

Basic Concepts. Cohen's kappa is a measure of the agreement between two raters who determine which category a finite number of subjects belong to whereby agreement due to chance is factored out. The two raters either agree in their rating (i.e. the category that a subject is assigned to) or they disagree; there are no degrees of disagreement (i.e. no weightings).
