Integral equations as a generalization of eigenvalue equations. Certain homogeneous linear integral equations can be viewed as the continuum limit of eigenvalue equations. Using index notation, an eigenvalue equation can be written as $\mathbf{M} \mathbf{v} = \lambda \mathbf{v}$ where $\mathbf{M} = [M_{ij}]$ is a matrix, \mathbf{v} is one of its eigenvectors, and λ is the associated eigenvalue. Taking the continuum limit, i.e., replacing the discrete ...

It can be further verified that the above identity also applies when \mathbf{G} is a solution to the Helmholtz equation or wave equation and G is the appropriate Green's function. In such a context, this identity is the mathematical expression of the Huygens principle, and leads to Kirchhoff's diffraction formula and other approximations.

Anisotropic diffusion is based on partial differential equations, which can not only smooth an image in homogeneous regions but also preserve edges, shapes, and positions. The bilateral filter emerged as a fast alternative to the time-consuming anisotropic diffusion model and combines low-pass filtering with an edge-stopping function [93].
