In this book, Mark Hunter provides a novel approach to linking the trophic interactions of organisms with the cycling of nutrients in ecosystems. Hunter introduces the concept of the "phytochemical landscape"—the shifting spatial and temporal mosaic of plant chemistry that serves as the nexus between trophic interactions and nutrient dynamics.

The result is a series of feedback loops that link trophic interactions with the cycling of matter, mediated through the nexus of variation in autotroph chemistry on the phytochemical landscape (figure 1.1). These feedback loops represent powerful trait-mediated indirect effects (Werner and Peacor 2003) in which the chemical traits of primary producers link trophic interactions with nutrient cycling.

Phytochemical diversity itself is affected by numerous factors, including light, nutrients, herbivores, plant taxonomic diversity, and genetic variation (Hunter, 2016). The consequences of variation in phytochemical diversity can cascade up through consumer trophic levels to affect ecosystem parameters, including response diversity or resilience.
