Types of neighborhoods

Neighborhood operations

play a key role in modern digital image processing. It is therefore important to understand how images can be sampled and how that relates to the various neighborhoods that can be used to process an image.

Digital image processing techniques help in manipulation of the digital images by using computers. The three general phases that all types of data have to undergo while using digital technique are pre-processing, enhancement, and display, information extraction.

- A digital image is an image $f(x,y)$ that has been discretized both in spatial coordinates and brightness.
- The elements of such a digital array are called image elements or pixels. A simple image model:
- To be suitable for computer processing,

an image. $f(x,y)$ must be digitalized both spatially and in amplitude.

Fundamentals of Digital Image Processing - R-5

A thorough overview of the major topics in digital image processing — representation, processing techniques, and communication. Features covers aspects of image representation including

luminance, color, spatial and temporal properties of vision, and digitization.

Likewise, for a much more readable and practical book, look to Gonzalez and Woods, esp the third edition, which unlike Jain,

tries hard to provide the necessary foundation and exposition for readers without expertise in DSP and matrix algebra.

Fundamentals. 2. We

begin with certain basic definitions. An image defined in the “real world” is considered to be a function of two real variables, for example, $a(x,y)$ with a as the amplitude (e.g. brightness) of the image at the real coordinate position (x,y) .
